

Deploy in 3 Commands (Easiest Method!)

I've installed Railway CLI for you. Here's all you need to do:

Step 1: Login to Railway

Open a terminal and run:

```
railway login
```

This will open a browser window. Click "Authorize" to connect Railway CLI.

Step 2: Link to a New Project

```
cd /home/ubuntu/ride-alert-monitor  
railway init
```

Choose:

- "Create new project"
- Name it: "Ride Alert Monitor"

Step 3: Deploy!

```
railway up
```

That's it! Railway will:

1. Upload your code
2. Install dependencies
3. Start the monitoring service
4. Keep it running 24/7

Step 4: Add Environment Variables

The .env file is already configured, but Railway needs them as environment variables:

```
railway variables
```

Or go to your Railway dashboard → Variables tab and verify these are set:

- DATABASE_URL
- SMTP_HOST
- SMTP_PORT
- SMTP_USER
- SMTP_PASS
- SMTP_FROM

(They should auto-upload from your .env file)

Check It's Working

```
railway logs
```

You should see:

```
✓ Starting ride alert monitoring service...
✓ Connected to database
✓ Checking ride alerts every 2 minutes
```

That's It!

Your monitoring service is now running 24/7 on Railway.

No GitHub, no complicated setup - just 3 commands! 🎉

Need Help?

If any command doesn't work, just let me know and I'll guide you through it!
